

Slab Table

Medium

Cherry and white pine, identified by microanalysis performed at the Center for Wood Anatomy Research, Madison, Wisconsin, and at Winterthur, both in 1977. Limestone identified by Margaret Carruthers, Museum of Natural History, New York.

Description

The slab table is simply yet sturdily constructed to accomodate the heavy rectangular stone top. The plain rails include a band of molding along the top edge that is cut from the rails themselves rather than applied separately. Four slender cabriole legs end in double pad feet. The table's frame is reinforced with sturdy interior diagonal cross braces. The slab itself is polished black and white limestone, with fossilized shells clearly visible across its surface.

Dimensions

31.5 × 46.5 × 23 in. (80 × 118.1 × 58.4 cm)
